**ABSTRACT.** – *The Romanian Sector of Tisa Basin – Potential and Touristic Infrastructure.* This geographical space of a great complexity, afferent to the Romanian sector of Tisa Basin, is to be noticed by the components of the natural and anthropical background, which confers originality and attractivity to the touristic potential belonging to some major geographical regions: the Carpathians, Transylvania Depression, the Western Hills and Plain. In this respect, attractivities related to all the landscape categories of the glaciary, volcanic and sedimentary-calcareous Carpathian relief impose themselves, doubled by a climatic and hydrographic potential, with multiple valences. The anthropical patrimony, related to a complex historical evolution of the human community, is to be observed by a structure and a multicultural affiliation, resulted from the cohabitation and the contribution of the Romanian, Hungarian and German communities. In time, a touristic infrastructure was realized, belonging to the resorts of different functional profiles, complexities and dimensions, to cities and rural settlements, leading to a spatial repartition, with concentrations and dispersions attached to the primary, natural and anthropical touristic offer.
