**Abstract.- G.I.S model for estimating the medium coefficient of calcul from flow with Frevert formula** The calculating methodology of the runoff in smal catchements supose, using the rational formula, medium coefficient calcul of flow from the chatchements studied. The importance of knowing the coefficient value results because this characterizes the variability of flow in chatchements. Using the G.I.S. it is possible to realize an automatization of calcul, using for this the overlay type technique
