ABSTRACT: Tourist Risk Phenomena in the Basin of the Stanciu Valley (Vlădeasa Massif). *Tourist risk can appear both in the attractiveness potential and the infrastructure domain, and, eventually, in the economic profitability of the phenomenon in itself. It gets to greater proportions in the intensely exploited areas, where the equilibrium of the tourist system tends to be torn up by the intensity, polyvalence and lack of control of the anthropic factor. Due to the fact that in the basin of the Stanciu Valley we can nowadays talk only about a totally incipient tourist capitalization, the risks are reduced to the disequilibrium resulted from the mixture of other forms of interventions than those of tourist nature (forest, mining exploitation) that affect the attractive value of some objectives or the landscape in general. Typical natural risks also appear, such as the climatic ones.*
