ABSTRACT. - Sustainable Development Management. *Our paper focuses on defining the concept of sustainable from a geographical point of view as it compulsory has a territorial connotation, a spatial one that is characteristic of any geographical study. As a result we started from the premises that its defining elements were territorial cohesion, environmental preservation, natural resources preservation, demographical optimum, economic development, and social harmony. As the development phenomenon is not a linear one, neither lacking convulsions nor contradictions, it supposes, in order to be sustainable, an appropriate management. This management includes the following main aspects: use of renewable resources, resources complementarity, optimum relationship between population and resources, tolerable anthropic pressure, harmonisation of request and offer relationship, resilience to climatic change and permanent dissipation of negative impact in nature and in society. The conclusion of our study points out the complexity of the phenomenon of sustainable development, and also the possibility of optimising it through permanent and inspired management.*
