ABSTRACT. –*Impact of the Industrial Activity on the Demography in the Neighbouring Rural Area of Dej Municipium, between 1930 and 2004. Our paper focuses upon population dynamic in Dej area, on the changes determined by the industrial activity of the urban centre, along with the other social and economic changes, especially after 1989. The urban and rural populations’ features and their behaviour highlight the suburbanisation process affecting the population in Dej area. The urban and rural populations’ decrease in the area came together with other two phenomena: the population ageing and tendency of feminisation especially in the neighbouring rural space.*

¹ This paper was written for the international conference *Rural Space and Local Development* and then published in the conference volume having the same name (Vasile Surd and Vasile Zotic – editors and coordinators - Presa Universitară Clujeană, Cluj-Napoca, 2007, pp. 386-396). Unfortunately, in the respective volume, due to an editing omission, only the first author’s name was mentioned both in the contents and under the title of the paper. Therefore, the editors mentioned above accepted that we published this paper again under the name of both its authors, so that the correct version reached its readers. We would like to thank Professor Pompei Cocean for his advice and for the opportunity to publish our paper under these circumstances.
